▶ Original Phillips curve

$$\pi_t = -\phi u + \text{constant}$$

► Original Phillips curve

$$\pi_t = -\phi u + \text{constant}$$

► Expectations-augmented Phillips curve

$$\pi_t = \pi_t^e - \phi(u_t - u_n)$$

▶ Original Phillips curve

$$\pi_t = -\phi u + \text{constant}$$

▶ Expectations-augmented Phillips curve

$$\pi_t = \pi_t^e - \phi(u_t - u_n)$$

▶ If $\pi_t^e + \phi u_n = $ constant, then the above two equations are equivalent.

► Non-Accelerating Inflation Rate of Unemployment (NAIRU) : u_n.

▶ Non-Accelerating Inflation Rate of Unemployment (NAIRU) : u_n.

▶ NAIRU is the unemployment rate at which actual inflation is equal to expected inflation.

$$\pi_t = \pi_t^e - \phi(u_t - u_n)$$

▶ Non-Accelerating Inflation Rate of Unemployment (NAIRU) : u_n.

▶ NAIRU is the unemployment rate at which actual inflation is equal to expected inflation.

$$\pi_t = \pi_t^e - \phi(u_t - u_n)$$

▶ NAIRU is the lowest unemployment rate that can be sustained without causing inflation to accelerate.

▶ Non-Accelerating Inflation Rate of Unemployment (NAIRU) : u_n.

▶ NAIRU is the unemployment rate at which actual inflation is equal to expected inflation.

$$\pi_t = \pi_t^e - \phi(u_t - u_n)$$

▶ NAIRU is the lowest unemployment rate that can be sustained without causing inflation to accelerate.

▶ NAIRU is not directly observable, not constant, and not known with certainty.
